For all the details about the Well-contact Plus system, refer to the installer manual that can be downloaded from the Software ➔ Product Software ➔ Well-contact Plus section on the website [www.vimar.com](http://www.vimar.com).

## General features and functionality

Weather station, KNX standard, power supply 12-32 Vdc or 12-24 Vac. Can be integrated with the By-me home automation system.

01546

### General information

The device measures quantities such as temperature, wind speed, rainfall, and brightness whose values can be used for viewing on supervisors or, on exceeding a threshold, to activate automation systems in the installation. The KNX weather station 01546 can be integrated with the By-me home automation system via a dedicated configuration using the EasyTool Professional software.

### Characteristics

- Auxiliary supply voltage AUX: 12-32 V  $\overline{\text{=}}$ , 12-24 V~ SELV
- AUX current draw: 100 mA max, ripple 10%
- Current draw from the Bus: 10 mA
- Terminals:
  - Auxiliary power supply AUX
  - TP bus connector
- Configuration push-button
- Configuration LED
- Configuration LED: 254 max
- Possible associations: 255 max
- Communication objects: 109
- Rain sensor heating: approximately 1.2 W
- Temperature measurement range: -40°C to +80°C
- Definition (temperature): 0.1°C
- Accuracy (temperature):
  - 1°C with -10°C - +85°C
  - 1.5°C with -25°C - +150°C
- Wind measurement range: 0 - 70 m/s
- Definition (wind): <10% of the reading
- Accuracy (wind): 25% with 0 - 15 m/s with an angle of incidence of 45° and mounting on a suitable support
- Brightness measurement range: 0 - 150,000 Lux
- Definition (brightness):
  - 1 Lux with 0-120 Lux
  - 2 Lux with 121-1,046 Lux
  - 63 Lux with 1,047-52,363 Lux
  - 423 Lux with 52,364-150,000 Lux
- Accuracy (brightness): 35%
- Operating temperature: -30°C - +50°C (outdoor use)
- Protection class: IP44
- Dimensions: 96x77x118 mm (W x H x D)
- Weight: approximately 170 g

### Operation

- **Brightness measurement:** the current brightness is measured by the specific sensor.
- **Wind measurement:** the strength of the wind is measured electronically and is quiet and reliable even in the event of hail, snow and sub-zero temperatures.

### FRONT VIEW.

1. Fast spring terminal for auxiliary power supply AUX; terminal assignment is independent of polarity (+/- or -/+). Use a solid cable of cross-section up to 1.5 mm<sup>2</sup> or a stranded cable.
2. Connector for connecting the cable of the precipitation sensor located under the front cover of the weather station.
3. Space for feeding through the power supply cable and the Bus cable.
4. KNX TP Bus connector (-, +). We recommend using the KNX cable art. 01890 using a corrugated pipe for the outside or to protect the cable from UV radiation.
5. Configuration button.
6. Configuration LED.

The weather station is also able to detect whirlwinds and updraughts.

- **Precipitation measurement:** the weather station is equipped with a sensor with a heated surface so that only the raindrops and snowflakes (and therefore not fog or dew) are measured as precipitation. Once it has stopped raining or snowing, the sensor dries quickly and the precipitation message is turned off.
- **Temperature measurement:** the weather station measures the value of the current ambient temperature.
- **Control outputs for all values:** the limit values can be set via the respective parameters or via the ETS communication objects.
- **8 AND logic gates and 8 OR logic gates each one with 4 inputs:** the control operations themselves as well as the 8 logic inputs (in the form of communication objects) can be used as inputs for the AND and OR logic gates; the output of each gate can be configured as 1 bit or as 2 x 8 bits.

**IMPORTANT: Press the configuration button to assign the physical address to the device.**

### Behaviour after switching on the Bus

Switching on the Bus: the state will be set based on the setting of the parameters and the corresponding telegrams sent over the Bus.

### Behaviour after reset

As for Bus on.

## ETS parameters and communication objects

### List of existing communication objects and standard settings

No.	ETS name	Function	Description	Type	Flag 1						Priority
					C	R	W	T	U	I	
0	Night control output	Output	Sends the command over the BUS when the "Night" condition occurs (1 = Night   0 = Day).	1 bit	C	R	-	T	-	-	Low
1	Rain control output	Output	Sends the command over the BUS when the "Rain" condition occurs (1 = Rain   0 = No Rain).	1 bit	C	R	-	T	-	-	Low
2	Logic input 1	Input	Input that can be enabled to be used for performing the logic functions made available by the weather station.	1 bit	C	R	W	-	-	-	Low
3	Logic input 2	Input	Input that can be enabled to be used for performing the logic functions made available by the weather station.	1 bit	C	R	W	-	-	-	Low
4	Logic input 3	Input	Input that can be enabled to be used for performing the logic functions made available by the weather station.	1 bit	C	R	W	-	-	-	Low
5	Logic input 4	Input	Input that can be enabled to be used for performing the logic functions made available by the weather station.	1 bit	C	R	W	-	-	-	Low
6	Logic input 5	Input	Input that can be enabled to be used for performing the logic functions made available by the weather station.	1 bit	C	R	W	-	-	-	Low
7	Logic input 6	Input	Input that can be enabled to be used for performing the logic functions made available by the weather station.	1 bit	C	R	W	-	-	-	Low
8	Logic input 7	Input	Input that can be enabled to be used for performing the logic functions made available by the weather station.	1 bit	C	R	W	-	-	-	Low
9	Logic input 8	Input	Input that can be enabled to be used for performing the logic functions made available by the weather station.	1 bit	C	R	W	-	-	-	Low
10	Temperature sensor error	Output	Indicates malfunctioning of the weather station temperature sensor (0 = OK   1 = NOT OK).	1 bit	C	R	-	T	-	-	Low
11	Wind sensor error	Output	Indicates malfunctioning of the wind sensor (0 = OK   1 = NOT OK).	1 bit	C	R	-	T	-	-	Low
12	Measured value temperature	Output	Lets you know the temperature measured by the weather station in °C.	2 bytes	C	R	-	T	-	-	Low
13	Min/max temperature request	Request	Requests the weather station to send the measured minimum and maximum temperature values over the Bus.	1 bit	C	R	W	-	-	-	Low
14	Measured min. temperature value	Sends min. temperature	Lets you know the minimum temperature measured by the weather station in °C.	2 bytes	C	R	-	T	-	-	Low
15	Measured max. temperature value	Sends max. temperature	Lets you know the maximum temperature measured by the weather station in °C.	2 bytes	C	R	-	T	-	-	Low
16	Min/max temperature reset	Temperature reset	Deletes the saved minimum and maximum temperature values.	1 bit	C	R	W	-	-	-	Low
17	Temperature 1 LV	Default value	Temperature 1 limit value: to set the setpoint of the limit value	2 bytes	C	R	-	T	-	-	Low
18	Temperature 1 LV	Actual value	Temperature 1 limit value: to read the actual limit value	2 bytes	C	R	W	-	-	-	Low
19	Temperature 2 LV	Default value	Temperature 2 limit value: to set the setpoint of the limit value	2 bytes	C	R	-	T	-	-	Low
20	Temperature 2 LV	Actual value	Temperature 2 limit value: to read the actual limit value	2 bytes	C	R	W	-	-	-	Low

## ETS parameters and communication objects

### Reference ETS parameters

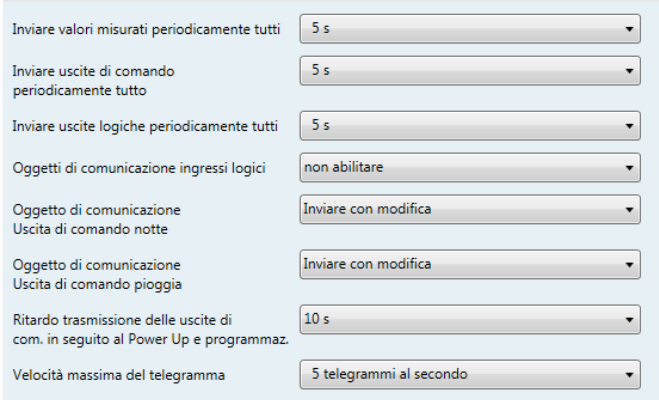

**Behaviour in the event of a power failure and when power is restored.**

**Behaviour if there is no Bus voltage or auxiliary voltage:**  
The device transmits no data.

**Behaviour if there is no Bus voltage or auxiliary voltage and subsequent programming or restarting:**  
The device sends all the measured values, control outputs and the status of the logic gates according to the behaviour set by the parameters in the "General Settings". When powering up, information will be sent with a settable delay.

### General settings

ETS text	Available values [Default value]	Comment
Send measured values periodically all	5 s ... 2 h [5 s]	
Send control outputs periodically all	5 s ... 2 h [5 s]	
Send logic outputs periodically all	5 s ... 2 h [5 s]

Limit value set by "Comm. object saving the last value"

**Note:** If the threshold value is set by a communication object, the threshold value must be specified during configuration because this value remains valid until the 1st object is sent with the new threshold value. In the case of weather stations that have already been put into service, the last threshold value sent by the communication object is used. If a threshold is set once using the parameter or a communication object, the last set threshold value remains until a new threshold value is transmitted by a communication object. The last threshold values set by the communication objects are saved in EEPROM memory, so as to preserve the values during a power failure that are then available when power is restored.
